

Vyacheslav Dzhagaev

Backend Engineer — Event-driven systems (NestJS) · Growing in Go

- ◆ Open to relocation – Serbia · Cyprus · Netherlands · Georgia
- ◆ Currently based in Volgograd, Russia ◆ slava.dzhagaev@proton.me ◆ vdzhagaev.tech
- ◆ github.com/vdzhagaev

SUMMARY

Backend engineer with **3+ years of commercial experience**, primary author and maintainer of a production **NestJS / MongoDB** platform built on **hexagonal architecture and domain events** — an event-sourced outbox, CQRS-style read models, and a multi-stage **BullMQ** pipeline that escalates from static checks to **Playwright/CDP browser automation** against third-party services. Comfortable owning a feature end-to-end, backend through the **Angular** UI that consumes it. Actively specialising in **Go** for self-hosted, API-first services, and going deeper into **Rust** through hobby projects, starting with **pokeroll**. Looking for a backend role in the EU with relocation support.

SKILLS

CORE

TypeScript NestJS Node.js Go SQL Rust

BACKEND

REST APIs Hexagonal architecture DDD · domain events

EXPERIENCE

Full-Stack Engineer, Comrade Digital Marketing Agency

Mar 2023 – Present

Remote (Chicago, USA)

- Primary author and maintainer of a link-building / backlink-monitoring backend (**NestJS + MongoDB**, pnpm monorepo) — designed the **hexagonal architecture** from scratch: domain layer with events-as-outbox, use-case layer, infra adapters, and an explicit DI registry so each deployable app only wires the providers it needs.
- Designed a **3-stage escalating verification pipeline** (index probe → static HTTP fetch → headless-browser render) as chained **BullMQ** queues, each with its own concurrency and rate-limit profile.
- Built two **Playwright/CDP browser-automation** workers driving persistent authenticated Chrome sessions against third-party SEO tools to collect metrics unavailable via public APIs.
- Bootstrapped a separate **content-workflow tool** (NestJS/MongoDB) from scratch and owned it through several schema migrations.
- Built the corresponding **Angular** feature (ag-grid server-side-row-model tables) end-to-end on top of the backend above — same feature, both ends of the stack — with light maintenance support on a legacy **Laravel (PHP)** tool.
- Dockerised services, Bitbucket Pipelines CI/CD, shared internal packages across the monorepo.

Software Developer (IT), Volgograd State Technical University

2020 – 2023

Volgograd, Russia

- Maintained the university's **remote-learning platform** used by students and staff.
- Built internal tools to streamline administrative workflows.
- Supported the **online admissions campaign** infrastructure over multiple admission cycles.

SELECTED PROJECTS

watchlight GO · WIP

github.com/vdzhagaev/watchlight

Uptime-monitoring service in Go (work in progress). Working core: an HTTP API for monitor CRUD, SQLite storage behind an interface, HTTP/ping checkers, and a background scheduler running each check on its own interval with graceful shutdown (`signal.NotifyContext`); `chi` router, structured `slog` logging. Migrations, incidents and alerting are next.

pocket GO · EARLY

github.com/vdzhagaev/pocket

A small URL-shortener HTTP service in Go: create / redirect / delete short aliases, storage behind an interface, `chi` middleware (request ID, panic recovery), Basic Auth, YAML + env config, structured `slog` logging. Groundwork for a planned pocket-tools chat bot.

Cross-platform desktop widget (**Tauri 2**: SvelteKit front end, Rust backend) that rolls a random Pokémon from PokéAPI and renders it as a card — sprite, types, base stats, and trainer XP/levels. Fetches from an external API, renders pixel/ASCII art on the fly, persists progress locally, and lives in the system tray. Shipped as a public beta with builds for Windows / macOS / Linux — my most complete project so far, and the one I'm using to push my Rust past beginner level.
